1. The reasons for building a residual salt model
2. The field site in Bygholm, Horsens
3. Data used
4. Modelling approaches
5. Modelling results
6. Future outlook

1. Why a residual salt model?

Goal:

To develop a model that will be able to predict the development of residual salt on the road after spreading, taking traffic, road and weather parameters into consideration.

The model will be available in a range of different complexity levels, from simple printed nomogram graphs to comprehensive algorithms for implementation in existing decision support systems.

It will help reaching a more precise and sound use of salt application rate, without compromising traffic safety and road network accessibility

2. THE FIELD SITE BYGHOLM

The field site consist of a ca 600 m long, 10 m wide test track with an RWIS-system (VAISALA Rosa) installed in the center position including four salt sensors (wheel tracks and in-between wheel tracks).

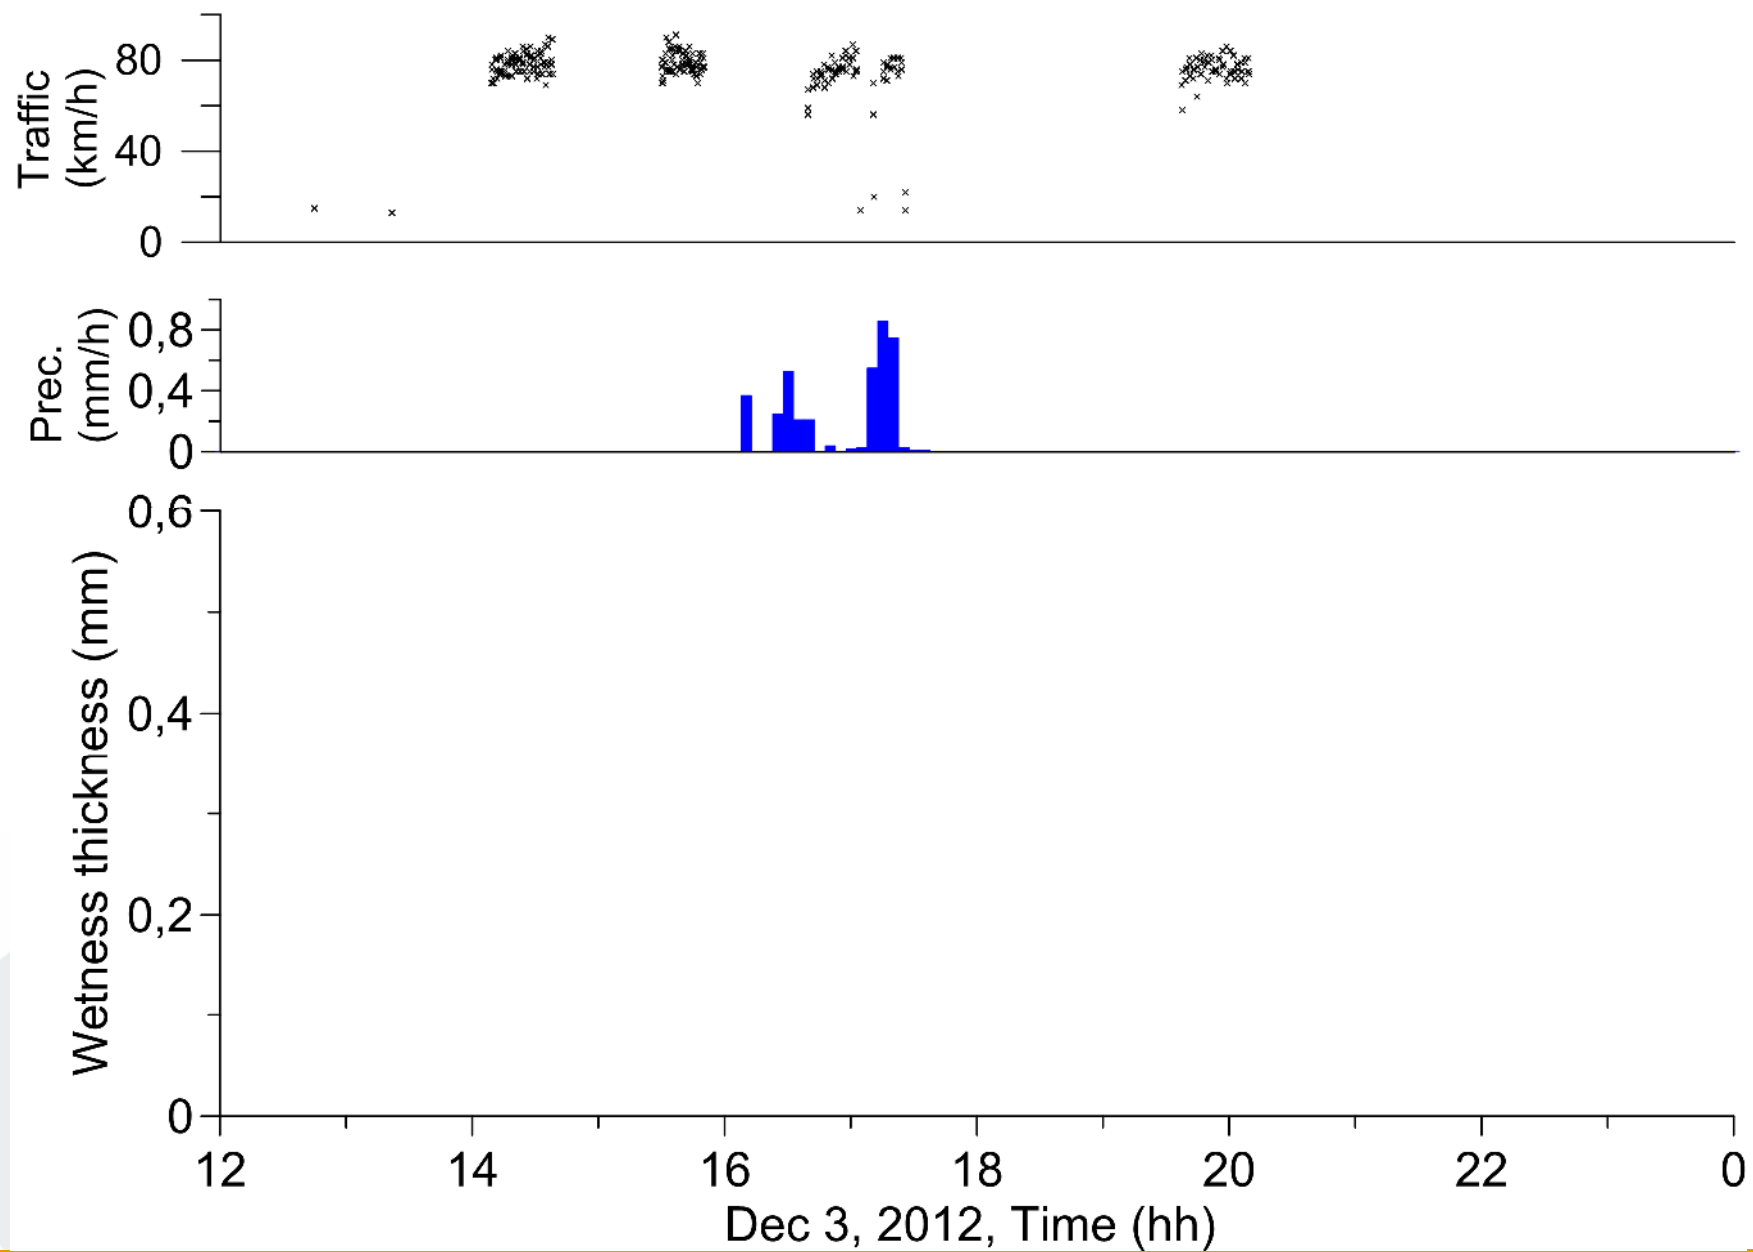

3. Automatic RWIS-sensors VAISALA Rosa

- 1. Precipitation: Vaisala PWD12**
- 2. Air Temperature: Vaisala HMP155**
- 3. Air humidity: Vaisala HMP155**
- 4. Wetness and salt amount: Vaisala DRS511**
- 5. Road surface state (wetness): Vaisala DSC111**

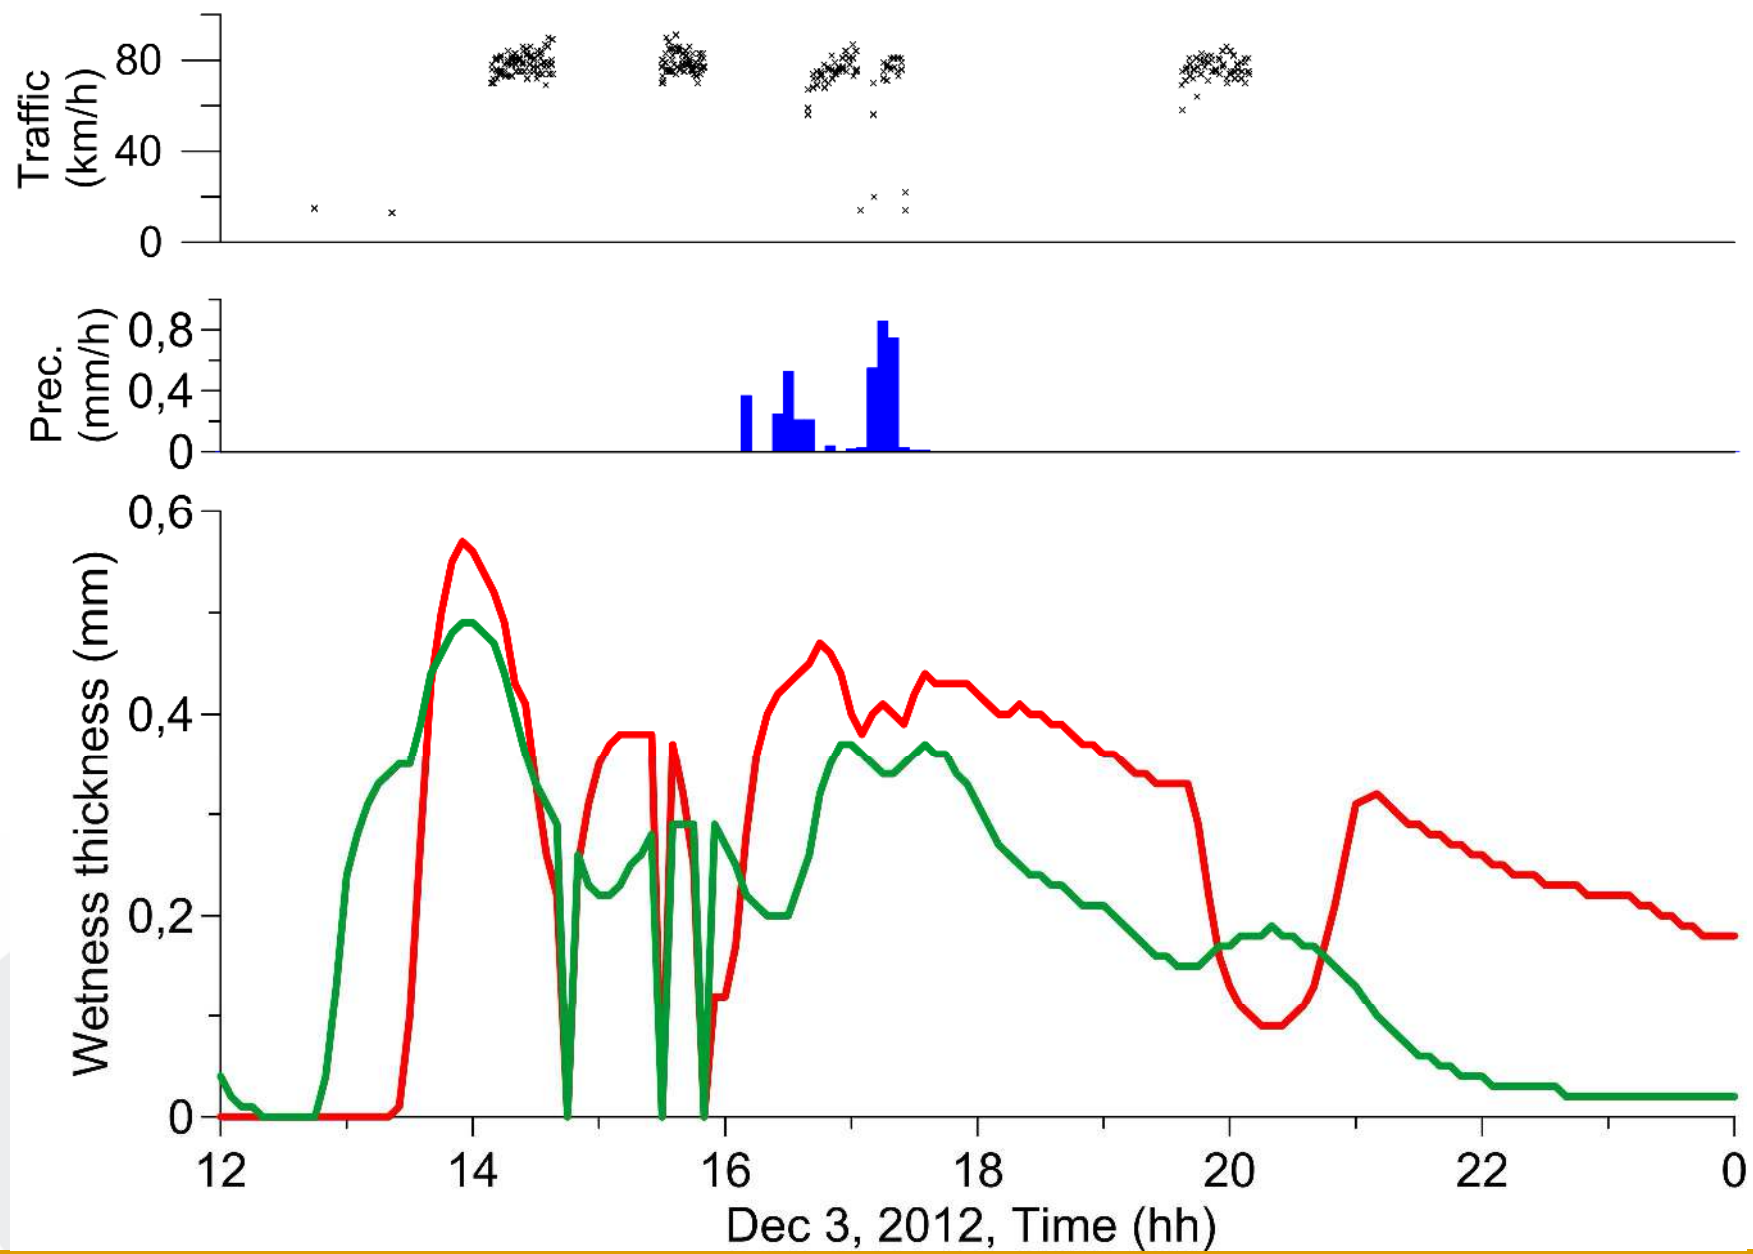

3. Manual measurements

- 1. SOBO 20 (dissolved salt amount up to 45 g/m²)**
- 2. VTI-Wet dust sampler (salt amount)**
- 3. Refractometer (salt concentration)**
- 4. Wettex kitchen cloth (wetness, g/m², including salt)**
- 5. Petri dishes (splash and spray deposition)**

1. Run-off model:

The run-off is modelled by an overland flow sub-model from Stanford Watershed Model IV (1989, 1966)

The model calculates a steady-state wetness based on:

- precipitation intensity
- length (half the road)
- crossfall

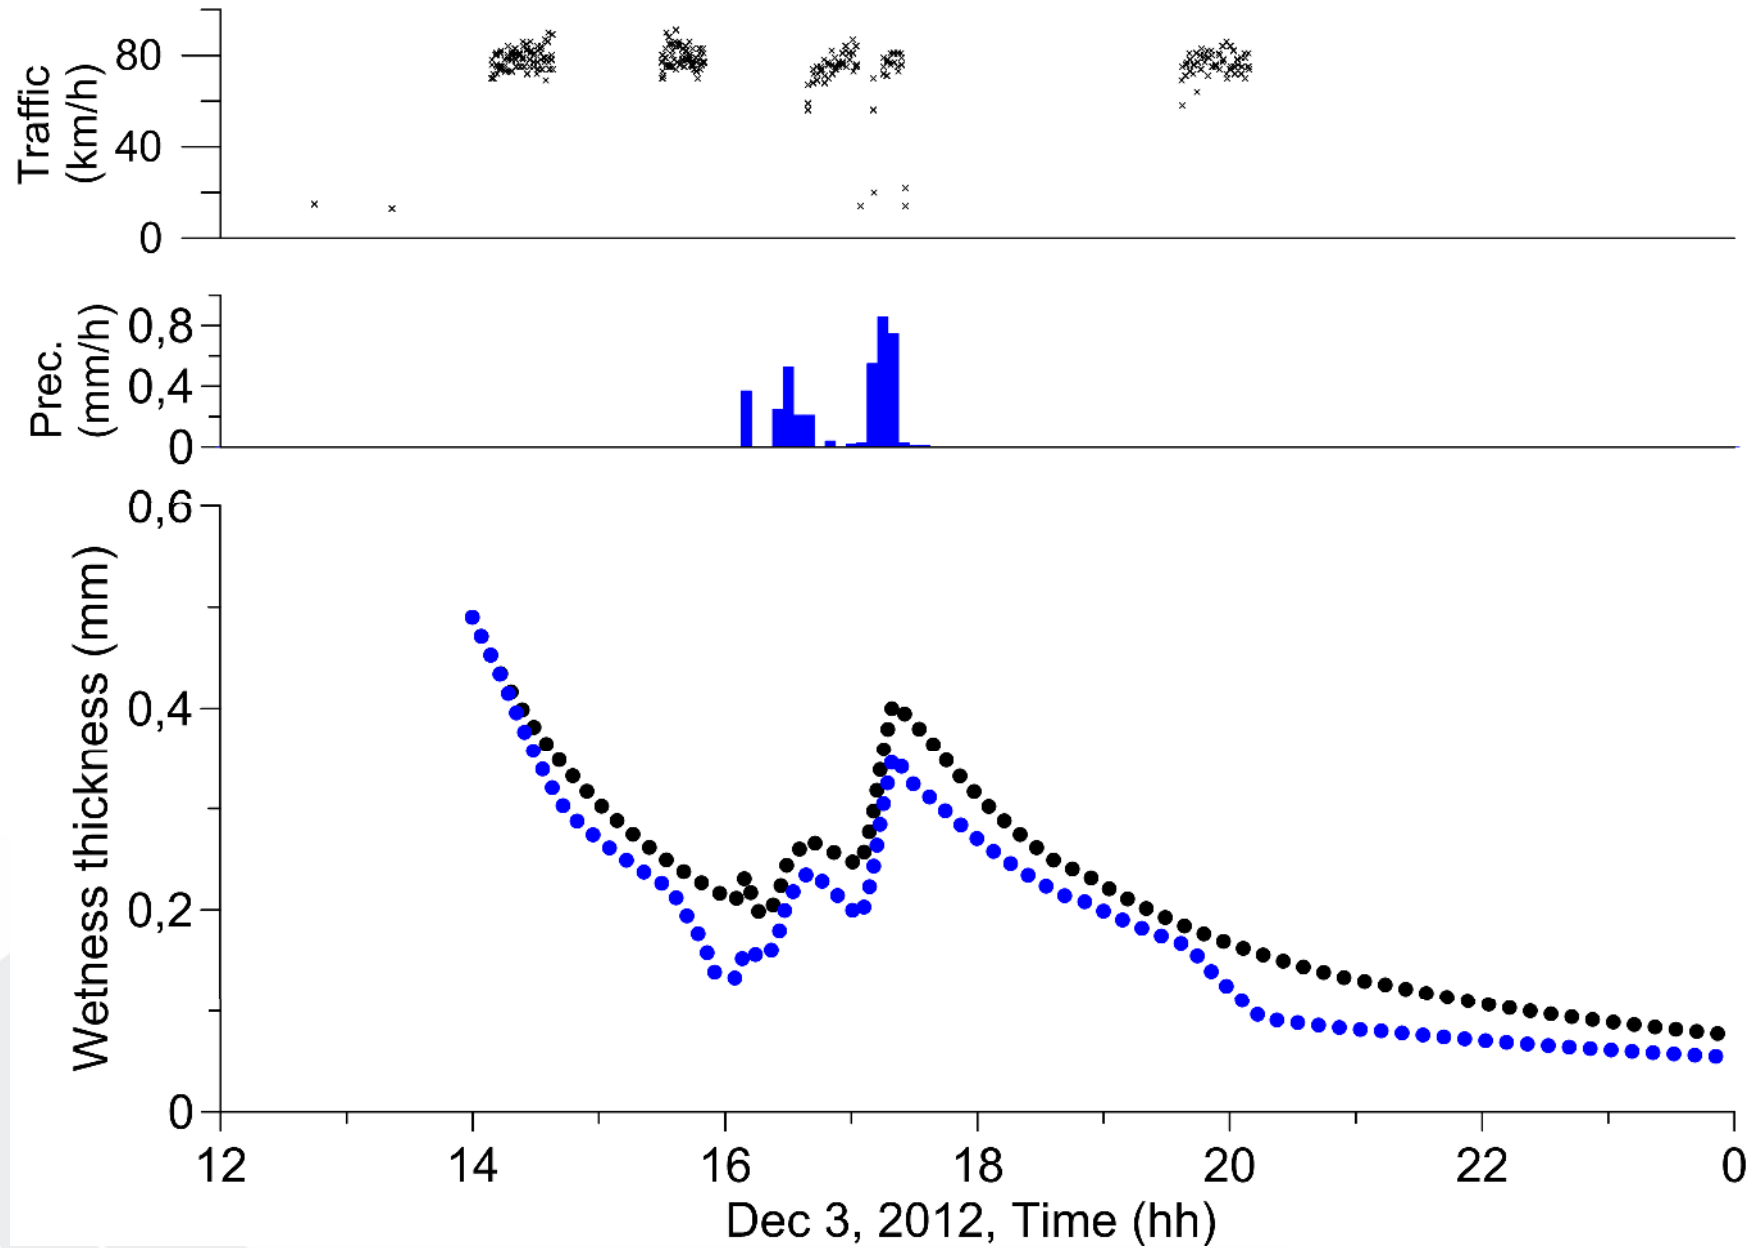

1. Splash and Spray model:

The splash and spray model is based on empirically found relationships between:

- road surface wetness
- road perpendicular wind component
- traffic
- road side depositions (petri dishes)

What's next...

This prototype model predicts the water loss from the road surface due to run-off and traffic induced splash and spray

Heavy traffic, evaporation and atmospheric condensation will be added in the next phase.

Loss of recrystallized salt from a dry road surface will be included as well as loss of undissolved salt particles by turbulence blow-off.

Establishing run-off properties for different pavements in lab.

We welcome contacts and discussions
