1. INTRODUCTION

1. INTRODUCTION

1. INTRODUCTION

- Complex **road weather forecasting** system
- Precise short-term local forecast of **road slipperiness**
- Synthesized and clear graphic information so the decision-making is truly simplified

**TO

3. CASE STUDY OF MDSS WEATHER FORECAST

- **10 regions** use MDSS since **2007–2013**
- **15 300 km roads = 15 300 segments** of motorways, expressways, Ist class and IInd class roads

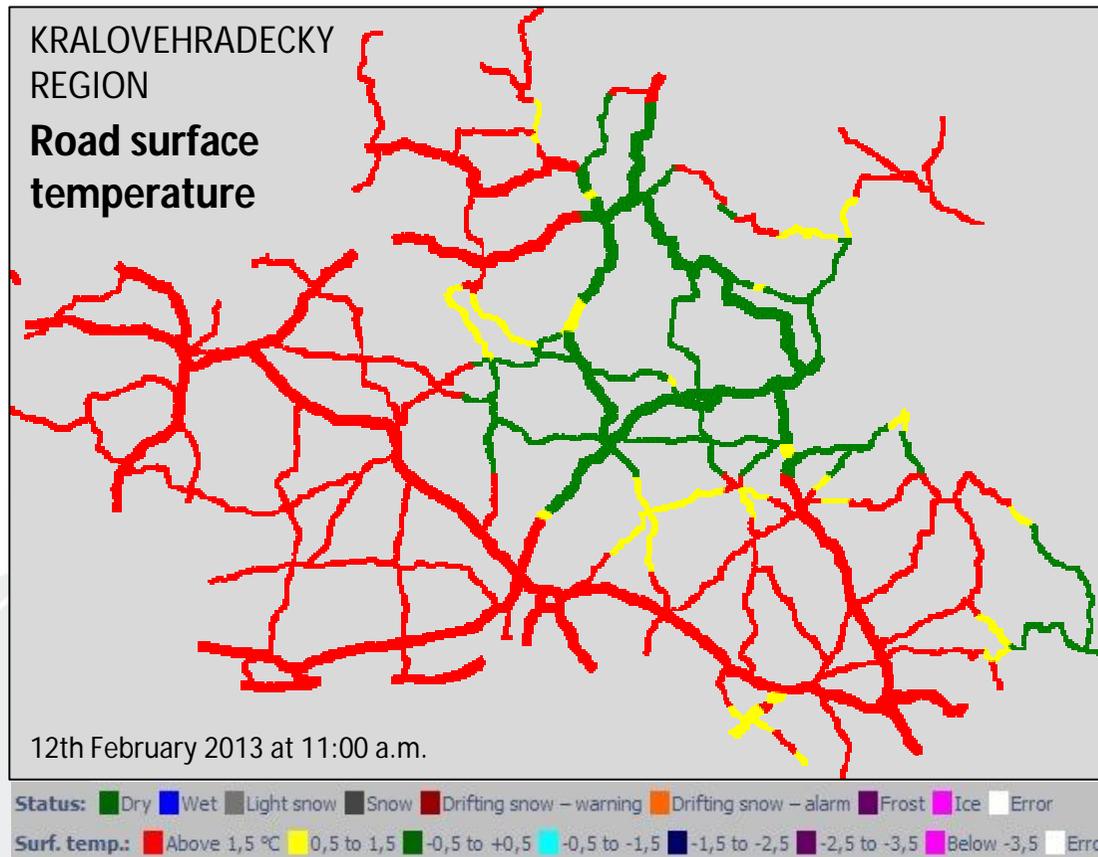

3. CASE STUDY OF MDSS WEATHER FORECAST

Forecast issued on 12th February 2013 at 01:00 a.m. +10 hours, i.e. on 12th February 2013 at 11:00 a.m.

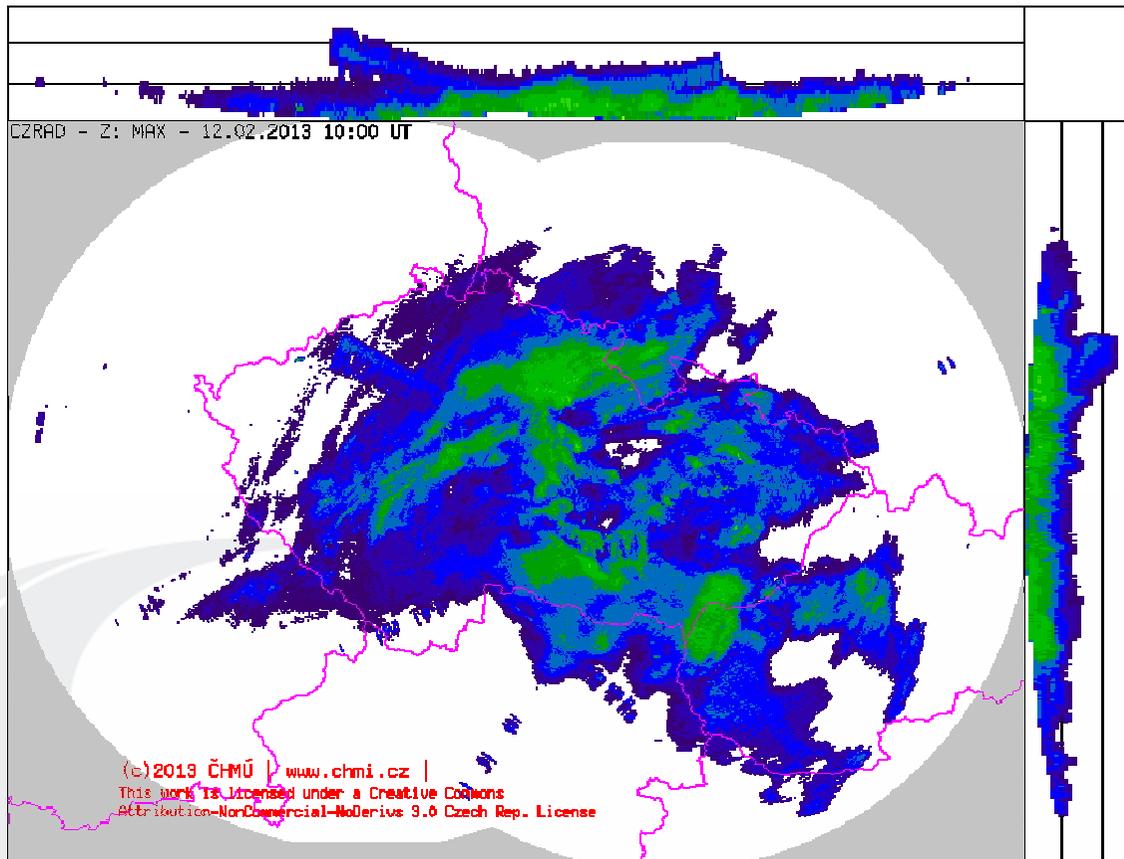

3. CASE STUDY OF MDSS WEATHER FORECAST

Forecast issued on 12th February 2013 at 01:00 a.m. +10 hours, i.e. on 12th February 2013 at 11:00 a.m.

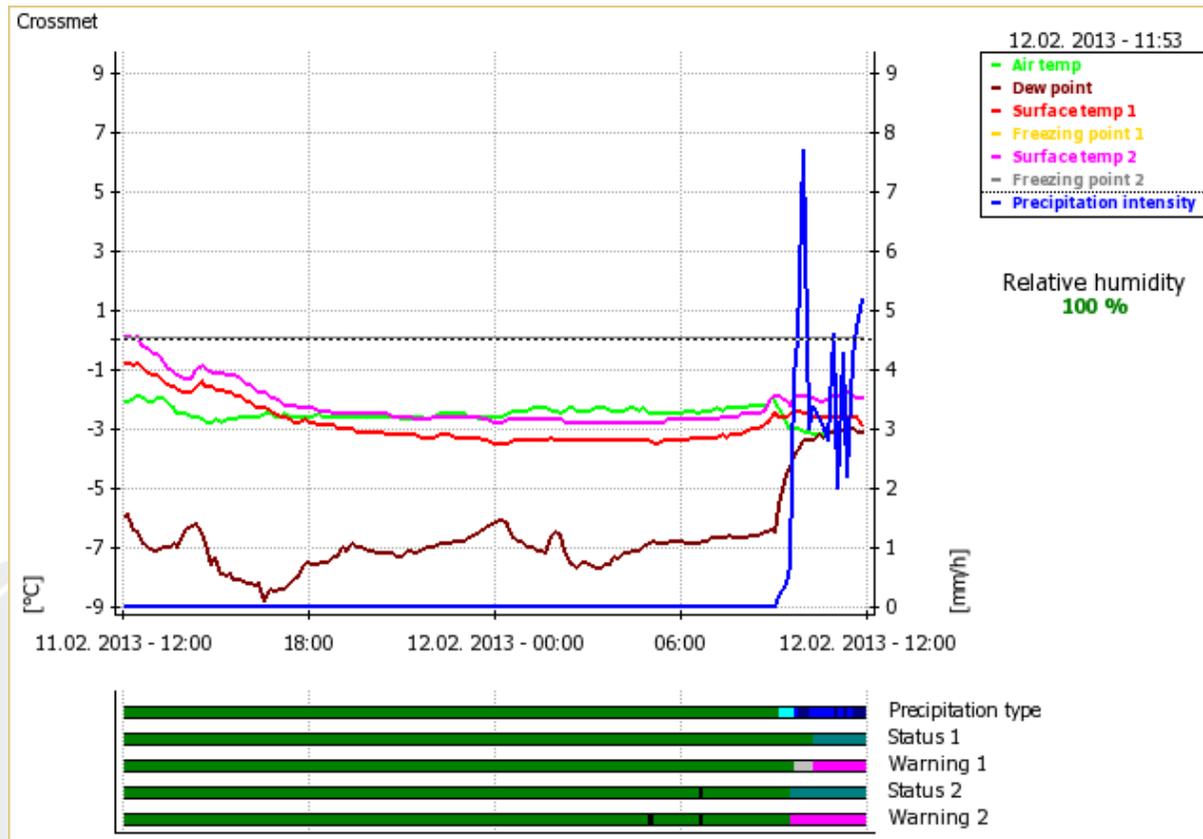

3. CASE STUDY OF MDSS WEATHER FORECAST

Radar picture of the Czech Republic in time 10:00 a.m. UTC

3. CASE STUDY OF MDSS WEATHER FORECAST

4. METHODS AND RESULTS OF THE FORECAST ACCURACY EVALUATION

- Analysis of the forecast accuracy of road surface status
 - Comparing the **predicted** and **later measured** road surface status, respectively station warning >>>

the error index

Status	DR	TR	MO	WE	WT	SN	PF	FR	IC	ER
Dry	2347	0	1743	29	0	0	56	0	0	3510
Wet	145	0	1682	119	0	0	41	0	0	828
DriftLow	0	0	0	0	0	0	0	0	0	0
DriftHigh	0	0	0	0	0	0	0	0	0	0
Snow	0	0	20	2	0	0	23	0	0	232
Slipp	25	0	63	3	0	0	30	0	0	349
Hazard	87	0	82	0	0	0	12	0	0	224
ER	0	0	0	0	0	0	0	0	0	36

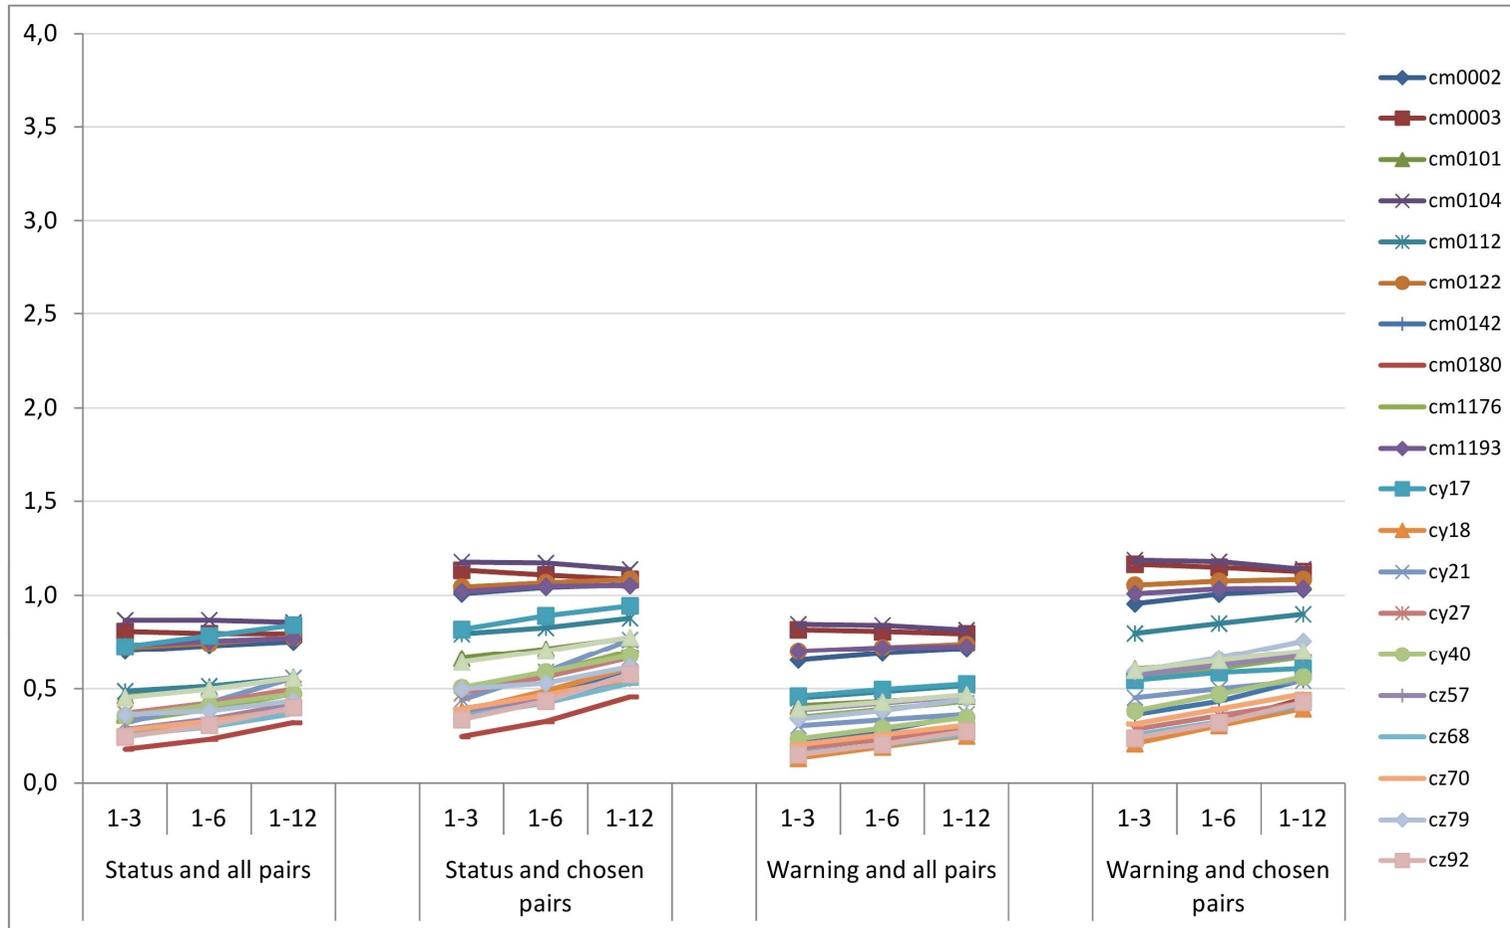

Error matrix – pattern

Status	DR	TR	MO	WE	WT	SN	PF	FR	IC
Dry	0	0	0	1	1	2	3	3	4
Wet	1	1	0	0	0	1	2	2	3
DriftLow	2	2	1	1	1	0	1	1	2
DriftHigh	2	2	1	1	1	0	1	1	2
Snow	2	2	1	1	1	0	1	1	2
Slipp	3	3	2	2	1	1	0	0	1
Hazard	4	4	3	3	1	1	1	1	0

Scale matrix

Forecast: **Dry**, **Wet**, **DriftLow** – Snow drifts warning, **DriftHigh** – Snow drifts alarm, **Snow**, **Slipp** – Frost, **Hazard** – Ice, Error.
Status measurement: **DR** – Dry, **TR** – Residual chemicals, **MO** – Moist, **WE** – Wet, **WT** – Wet and treated, **SN** – Snow, **PF** – Possible frost, **FR** – Frost, **IC** – Ice, **ER** – Error.
Warning measurement: **noW** – No warning, **R** – Precipitation, **S** – Snow, **F** – Frost, **W** – Ice warning, **A** – Ice alarm, **ER** – Error.

4. METHODS AND RESULTS OF THE FORECAST ACCURACY EVALUATION

4. METHODS AND RESULTS OF THE FORECAST ACCURACY EVALUATION

- Analysis of the forecast accuracy of road surface temperature
 - Comparing the **predicted** and **later measured** road surface temperature (predicted minus measured).
 - The result is a **derivation of the average error** alias **average absolute error** in determining the temperature.
 - Evaluation splits into two sub-analyzes:
 - Analysis of all pairs of measurement–forecast
 - Analysis of chosen pairs of measurement–forecast when it was measured RST below +3 °C

4. METHODS AND RESULTS OF THE FORECAST ACCURACY EVALUATION

Often pessimistic forecast
Less forecasted than measured

Often optimistic forecast
More forecasted than measured

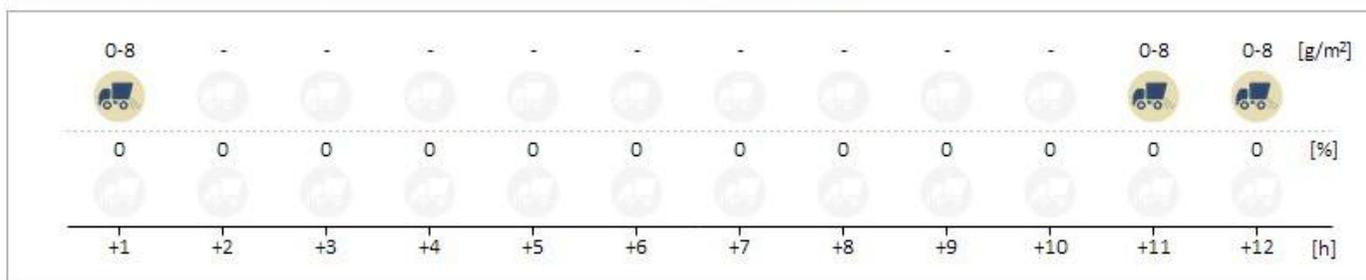

5. CONCLUSION

- Simplified planning of winter maintenance
- Remote supervision over the critical roads
- Winter maintenance efficiency
- Small direct cost saving as a planning of night and weekend readiness
- Winter season 2013/2014
 - SSWM full completion in the Czech Republic
 - Recommended treatment forecast

6. TREATMENT RECOMMENDATION – NEW 2014

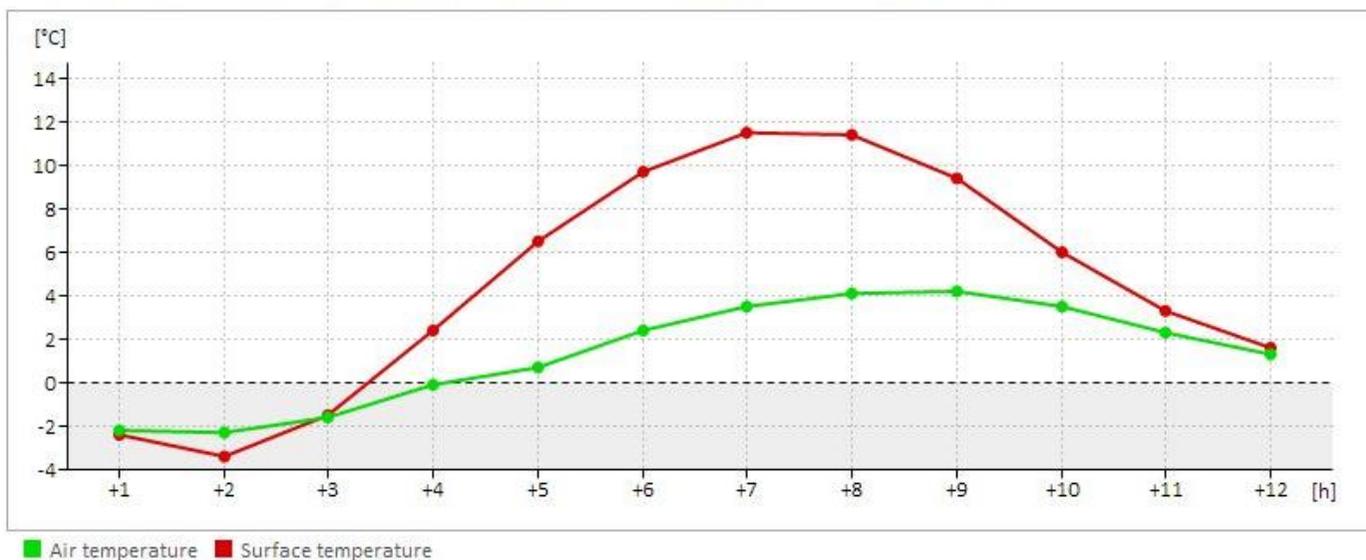

Recommended scenario for road maintenance

Graph contains probable need of chemical treatment and plough in a given hour. Percentage shows amount of roads in area covered by recommendation. For chemical treatment is also recommended weight range of spreading.

Meteorological forecast

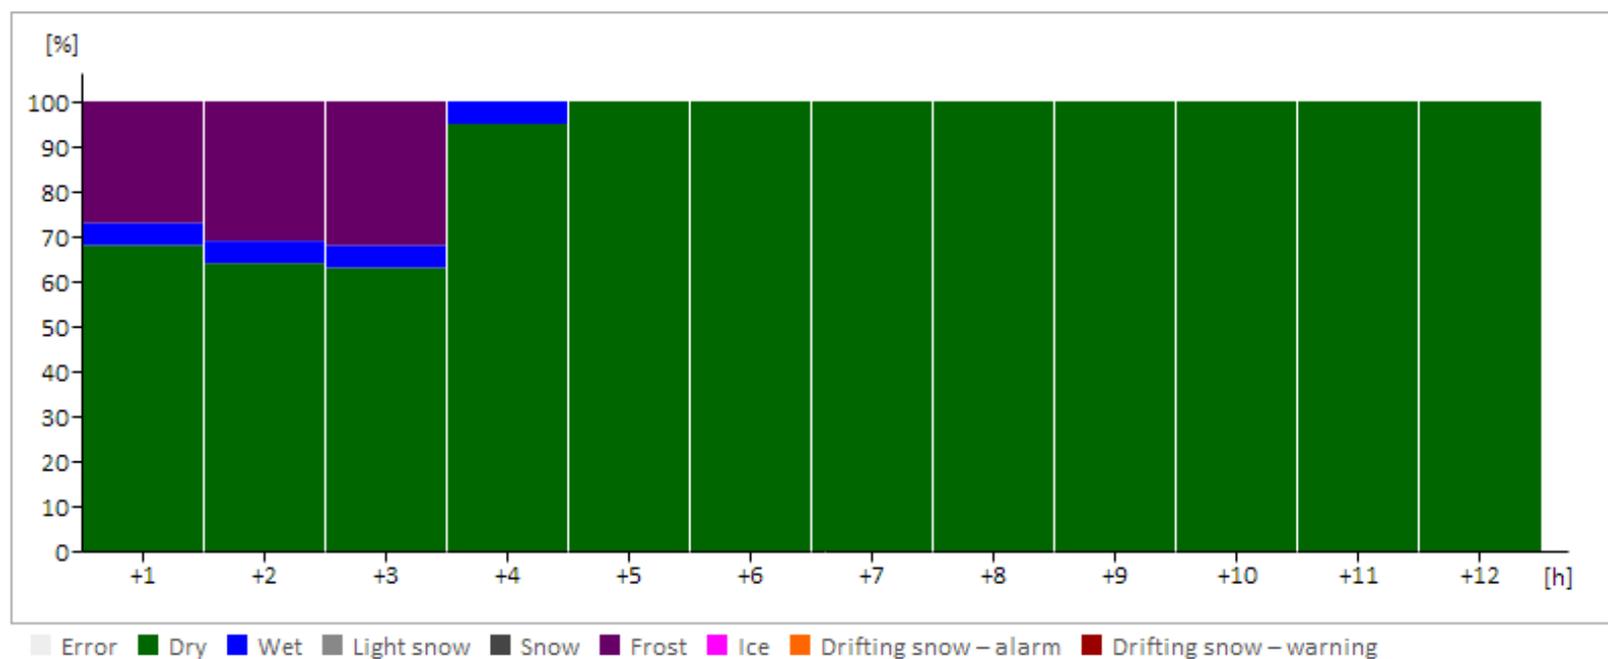

The graph contains mean temperature of air and road surface, which is counted from all roads in the area.

6. TREATMENT RECOMMENDATION – NEW 2014

Forecast of surface status

The graph shows percentage of roads in the area, which are classified into categories by probable state of road surface.
