### Snowstorm Visibility Information

2012/12/26

（凡例）
- ☐ Fine (over 1000m)
- ☐ ▲ (500 - 1000m)
- ☐ Poor (200 - 500m)
- ☐ ▼ (100 - 200m)
- ■ Marginal (lower than 100m)

▲ 主な峠　色の見にくい方はこちら

凡例の定義に関する詳細は、下記の「吹雪による視程の程度」をご覧下さい。

気象データの通信障害などの理由で、視界情報の更新が遅れる場合があります。本ページの情報は、運転の参考程度にお考えいただき、十分注意してご通行下さい。

This system provided ...
   present visibility ratings for
   5 visibility levels, covering
   46 areas at 30 minute intervals.

What do users need?
   Is the area detailed enough?
   Are there other forecast needs?
User needs survey was conducted.

### Visibility rating ( 5 - scales )

吹雪による視界の程度

| 良好 (1000m 以上) | やや不良 (500 ～ 1000m) | 不良 (200 ～ 500m) | かなり不良 (100 ～ 200m) | 著しい視程障害 (100m 未満) |
|---|---|---|---|---|
| 道路のかなり遠方や、遠く離れた山や丘、建物が見える程度です。 | 道路の線形や周囲の樹木などは割合にはっきりと見える程度の視程です。運転に影響を与えるほどの視程障害ではありません。 | 運転席から見てはっきりとした視界の悪さを感じます。矢羽根が3本以上見える程度の視程です。 | 矢羽根がかろうじて2本見える程度の視程です。局地的・一時的に視程が100m未満となることがあるので、注意が必要です。 | 矢羽根がかろうじて1本見える程度の視程です。一面真っ白で「まったく前が見えない」と感じることもあります。 |

* In order to reduce damages through the use of IT.
* Since 2009, this system provided visibility information of JMA data.
* Visibility levels indicated by using 5-color scale.
* Hokkaido was divided into 46 areas.

# Questionnaire Survey for System Modification

## Question on the ideal size of each area for which information is provided.

86% of respondents desired information for "smaller areas"
Division was changed to one based on municipality.
Number of divisions rose from 46 to 203.

Q: What is the ideal scale for each area of snowstorm visibility information provision?
Chose one of the items below.

Scale of current area (Weather Forecast 1st Division area) — 13%  Valid responses: 150

Municipality scale (Each area will be smaller than the current area.) — 61%

1 km X 1 km grid — 33%

Other — 1%

Respondents who chose a smaller area than the current area — 86%

0%  20%  40%  60%  80%  100%

# Questionnaire Survey for System Modification

## Question on the forecast lead times preferred by road users.

94% of respondents desired 1 - 6 hours lead time.
Up to 6 hourly forecasts to be provided.
Also provide 9, 12 and 24-hour forecasts.

Q: Forecasts of visibility distance on roads will be become possible in the near future. What is your preferred lead-time for such forecast information? (Choose as many as you like.)

| Lead time | Percentage |
|---|---|
| 1 hour | 45% |
| 3 hours | 67% |
| 6 hours | 16% |
| 12 hours | 9% |
| 24 hours | 11% |
| More than 24 hours | 3% |
| Respondents who chose lead times of 1 - 6 hours | 94% |

Valid responses: 150

# *Modified Snowstorm Visibility Information System*
## since Feb. 2013
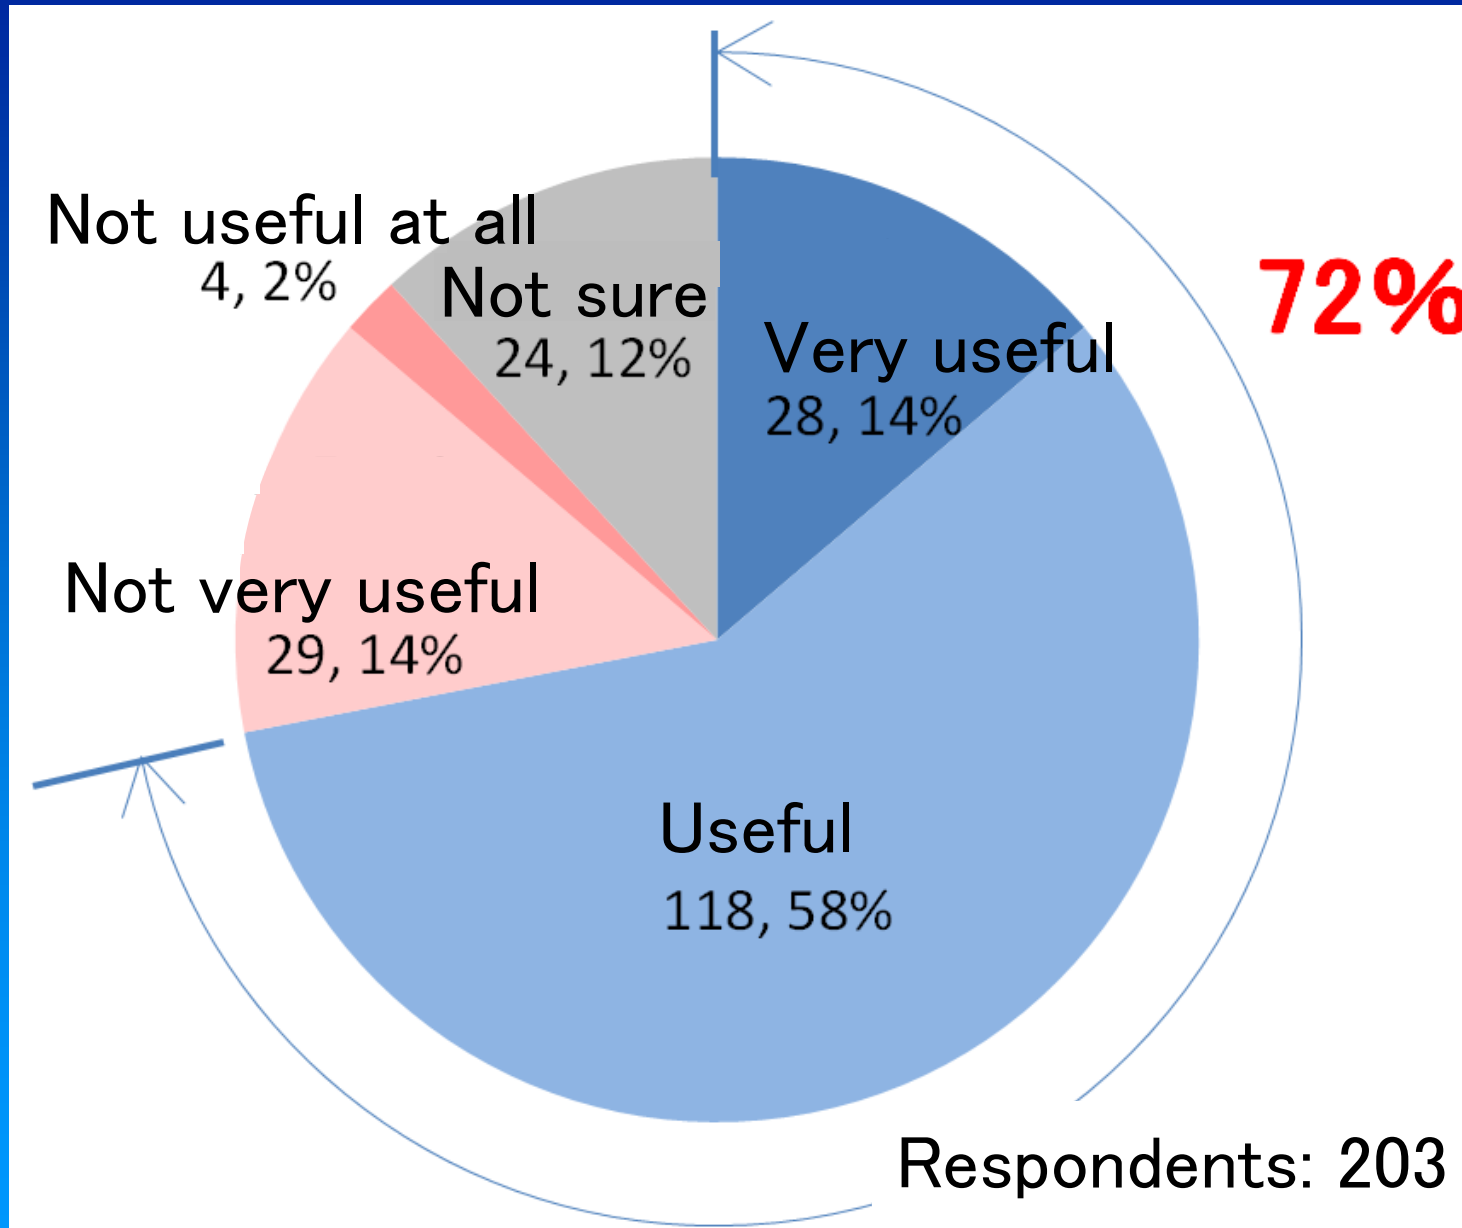

# The number of visitors to the Snowstorm Visibility Information Website
## ( after visibility forecast information was implemented )

March 9 and 10, 2013: Heavy snowstorms on the Sea of Japan side of Hokkaido

March 2 and 3, 2013: Heavy snowstorms throughout Hokkaido (9 casualties).

Max. daily visitors: 5,868 (March 9, 2013)

*Y-axis:* Daily number of visits (visit) — 0, 2000, 4000, 6000
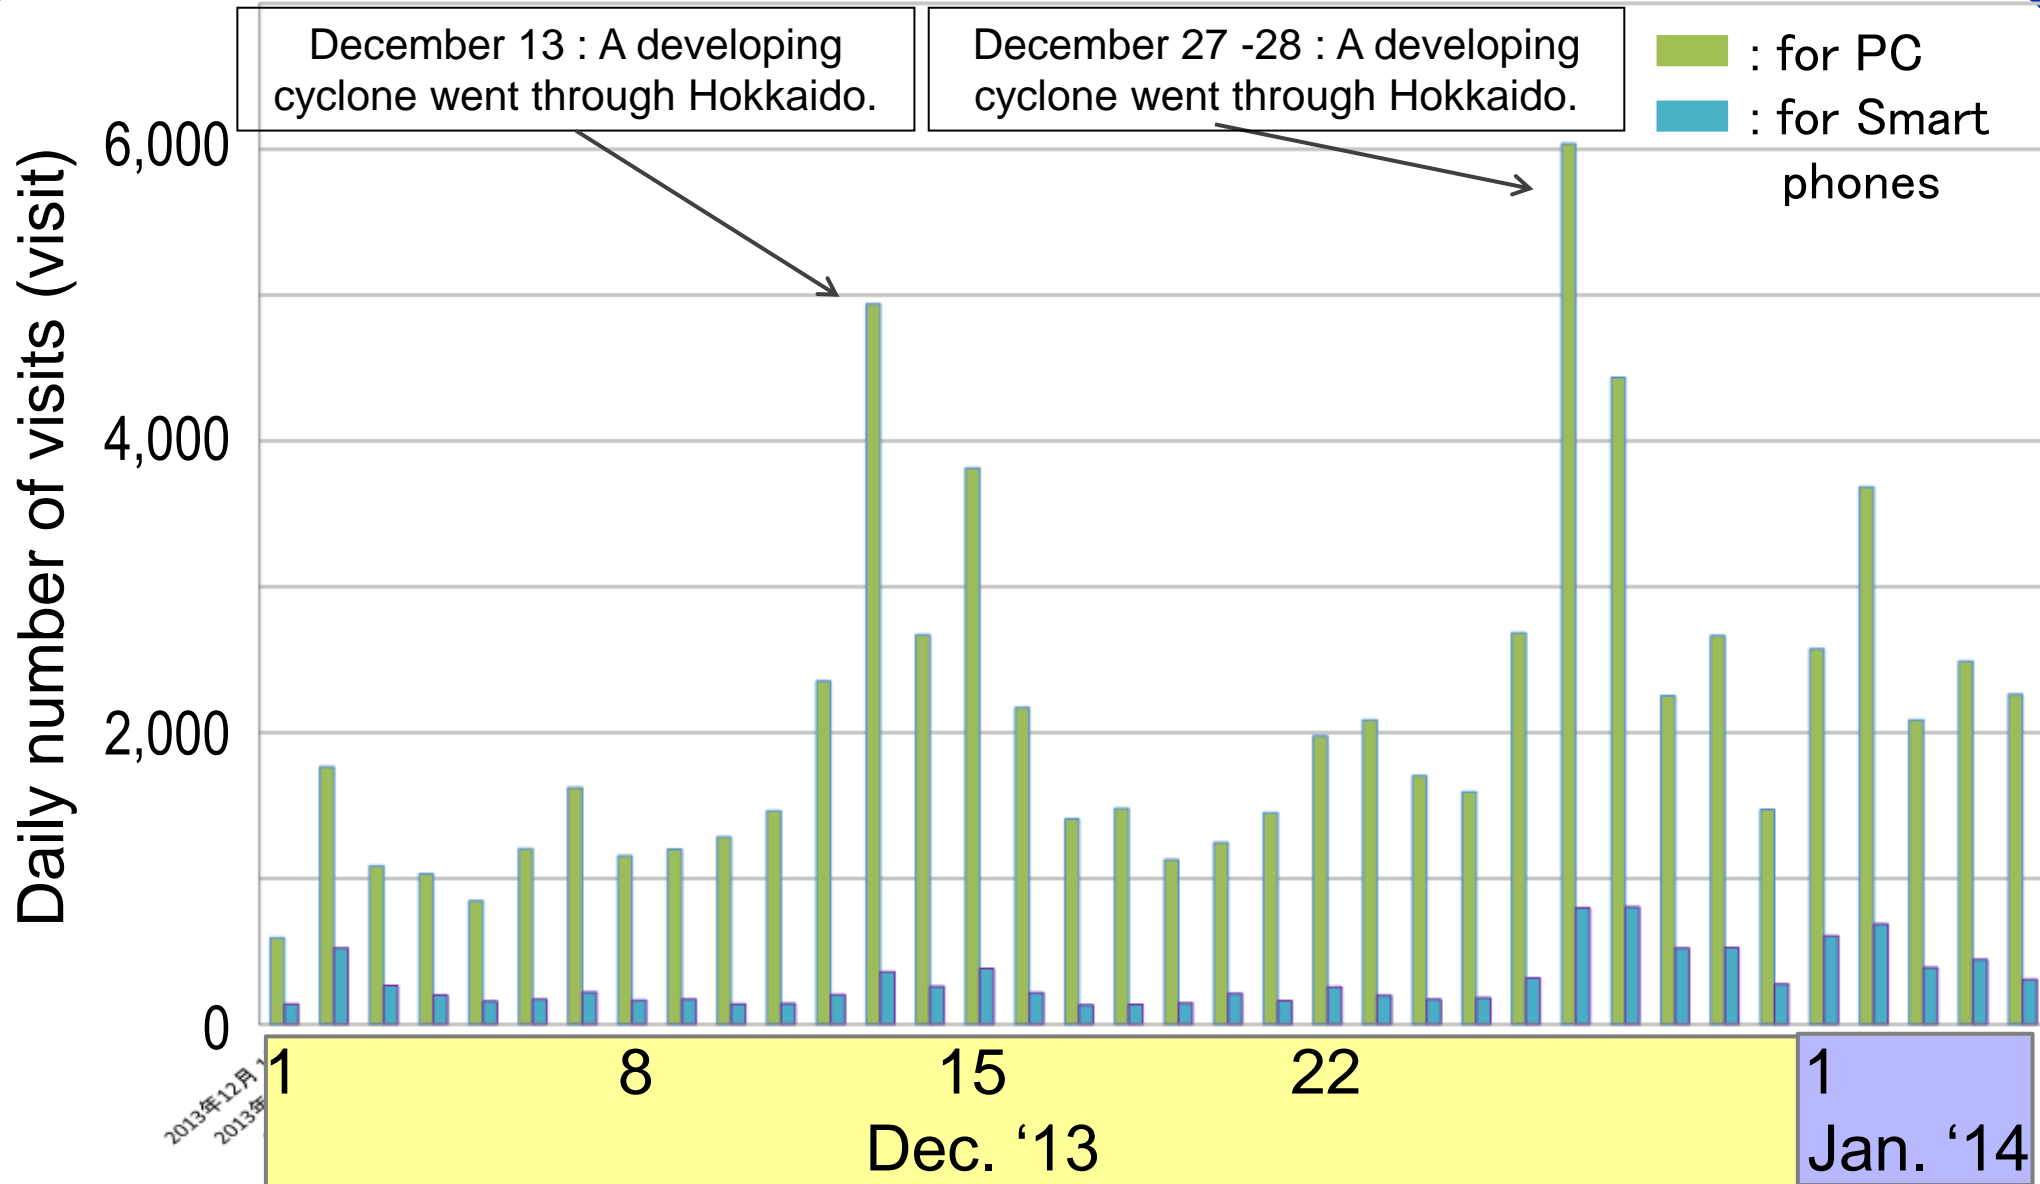

*X-axis:* 1, 8, 15, 22 — February | 1, 8, 15, 22 — March
* Visits have been increasing.
* After modification, typically 1500 visits/day.
* March 2-3, 5000, March 9-10, 6000 visits.
* Road users actively use info for decision-making.

# Questionnaire survey results on the usefulness of visibility forecast information provided

# Outline of the System for User-Uploaded Snowstorm Information Sharing

## Uploading by cellular phone

| Snowstorm information |
|---|
| Welcome, Mr. *** |
| ◆Data sheet |
| Please choose and fill items below |
| Time:16:43 |
| ▼Area |
| Central Hokkaido |
| ▼City |
| Sapporo |
| ▼Route |
| Route 5 |
| ▼Visibility |
| ◎Fine (over 1000m) |
| ○    (500-1000m) |
| ○Poor (200-500m) |
| ○    (100-200m) |
| ○Marginal (lower than 100m) |
| ▼Weather |
| ◎Sunny |
| ○Cloudy |
| ○Snowy |
| ○Stormy |
| ▼Comments |
|  |

The uploader's geographic coordinates are obtained from GPS or cell phone base stations.

Visibility information is uploaded.

System for User-Uploaded Snowstorm Information Sharing

Example of user-uploaded information

**Map window**

**Table-display window**

Viewing road-user-uploaded information

* Road surveillance cameras are expensive.
* Our forecast system is based on overall weather data.
* It is difficult to determine poor visibility in local areas.
* This system was developed to collect local visibility data by users.

COLD REGION

Northern
Road Research

# Automatic Road Image Capturing and Uploading System

**System image**

**Uploaded image (Map window)**

**GPS satellite**
The latitude and longitude coordinates of the location are obtained by GPS and are attached to the uploaded image.
**Dedicated software application**
The image capturing interval and image size can be set with the software application.
**Smart phone**
The phone is placed on the dashboard of the vehicle for automatic, continuous image capturing.

**Snowstorm**
Locations where the driver encountered a snowstorm during the trip

**Telecommunication**

WWW

Internet

**Server**
Automatic display of the captured image on the map

* User-uploaded system is feasible, but quantity was insufficient.
* It is very difficult to take photo and upload under poor visibility.
* This system was developed to be installed in buses, taxis, trucks.
* Smart phones already have cameras, GPS, data transmssion.

# *Conclusions*

To reduce damage caused by snowstorms, CERI developed the three information systems shown below.

1) The Snowstorm Visibility Information System which provides distribution of forecast visibility for up to 24 hours for local areas.

2) The User-Uploaded Snowstorm Information Sharing System which collects local visibility information with road users uploading data.

3) The Automatic Road Image Capturing and Uploading System which collects visibility images from equipment in commercial vehicles.

For disaster mitigation, it's important to assist drivers' decision-making.

We are planning a study on information content and descriptions which can effectively help drivers to make safer decisions.
